

Oscilloscope Measurement Labs

Triggering the Signal - Edge and Pulse Width Triggering

This lab exercise teaches general oscilloscope triggering and how to use edge triggering and pulse-width triggering, especially on a TDS2000 or TBS1000 Series oscilloscope.

Objectives

At the end of this laboratory session, you will be able to:

- Understand the basics of trigger systems / functions.
- Use edge trigger to capture a signal with rising or falling voltage
- Capture a signal when pulse width = or \neq specified value
- Capture a signal when pulse width $>$ or $<$ specified value

Equipment

To carry out this experiment, you will need:

- Arbitrary Function Generator (Tektronix AFG3022 or equivalent) signal generator
- Oscilloscope (Tektronix TBS1022, TDS2002, or equivalent)
- 50 Ω BNC cable
- 50 Ω BNC feed-through terminator (optional)

Theory

To perform this experiment, you should be familiar with:

- Oscilloscope user manual – vertical system and amplitude measurement
- XYZs of Oscilloscopes – Page 27, section: Trigger System and Controls
- XYZs of Oscilloscopes – Page 29, section: Trigger Position
- XYZs of Oscilloscopes – Page 29, section: Trigger Sources
- XYZs of Oscilloscopes – Page 30, section: Trigger Modes

Oscilloscope Measurement Labs

Triggering

Key Concepts:

Triggering is the process of capturing a waveform based on various criteria you specify. The trigger makes repetitive waveforms appear static on the oscilloscope display by capturing at the same point in the signal and repeatedly overwriting the signal with itself.

Types of Triggering:

You can use any channel (Ch1/Ch2/Ext) as a source for triggering. You can only have one trigger at any given time.

Figure 1. Edge Triggering

Edge Triggering: Edge triggering is a process of triggering on the first occurrence of a rising or falling voltage. You can set the trigger voltage level and choose rising or falling voltage.

Pulse Triggering. Pulse triggering, is a process of triggering on the first occurrence of a pulse with a specified pulse width. You can choose to trigger when pulse width is greater than, less than, approximately equal to, or not equal to a pulse width you specify. You can also specify the polarity of the pulse you want to capture, that is whether it is positive (rises then falls) or negative (falls then rises).

Triggering

Check Your Understanding

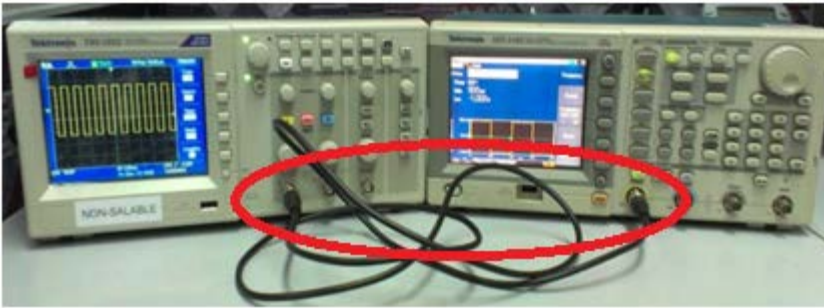

Answer the following:

1. Triggering is required (Check all that apply)
 - a. To make a signal appear clearly on the display
 - b. To display a specific part of a signal on the display
 - c. To make dynamic signal look static on the display
 - d. To acquire a signal with specific characteristics
2. Which of the following Trigger type is not present in TBS1000 or TDS2000 Series oscilloscope?
 - a. Pulse width
 - b. Glitch
 - c. Edge
 - d. Video
3. If you have an oscilloscope that captures 10 horizontal divisions, and a signal is acquired with horizontal resolution of $50\mu\text{S}/\text{div}$, what is the total duration of the acquired waveform?
 - a. $500\mu\text{S}$
 - b. $50\mu\text{S}$
 - c. $5\mu\text{S}$
 - d. $0.500\mu\text{S}$
4. A sinusoid is acquired with a horizontal scale/resolution of $1\text{mS}/\text{div}$. What would the frequency of this sine wave be if 3 cycles occupy 2.4 horizontal divisions?
 - a. 125 Hz
 - b. 1250 Hz
 - c. 416.7 Hz
 - d. 1k Hz

Oscilloscope Measurement Labs

Triggering

Experiment Setup

Step 1: DUT Setup	<p>Step - 1.2 : Connect the AFG/Signal Generator to AC power.</p> <p>Step - 1.3 : Turn ON the AFG.</p> <p>Step - 1.4 : Set the signal type, frequency and amplitude on AFG as per experiment requirements.</p> <p>Step - 1.5 : Enable the output on AFG channel</p>
Step 2: Measurement Setup	<p>Step - 2.1 : Power ON the oscilloscope.</p> <p>Step - 2.2 : Make the connection between Signal Generator/AFG and oscilloscope as shown in the below picture.</p>  <p>Step - 2.3 : Output of the AFG/Signal Generator is connected to Channel #1 of the oscilloscope*</p> <p>Step - 2.4 : Press Autoseg on the scope to display the signal generated by AFG</p>

* Note: A 2 Vp-p setting on most signal generators will produce 4 Vp-p into the 1 M Ω inputs on most oscilloscopes. This is because most signal generators are calibrated assuming a 50 Ω load. It won't affect the outcome of the lab. If you want the settings to match, you can add a 50 Ω feed-through terminator to the input of the oscilloscope. Alternatively, the AFG3022 has a setting in the Output menu called Load Impedance, that allows you to specify a High Z (high impedance) load.

Oscilloscope Measurement Labs

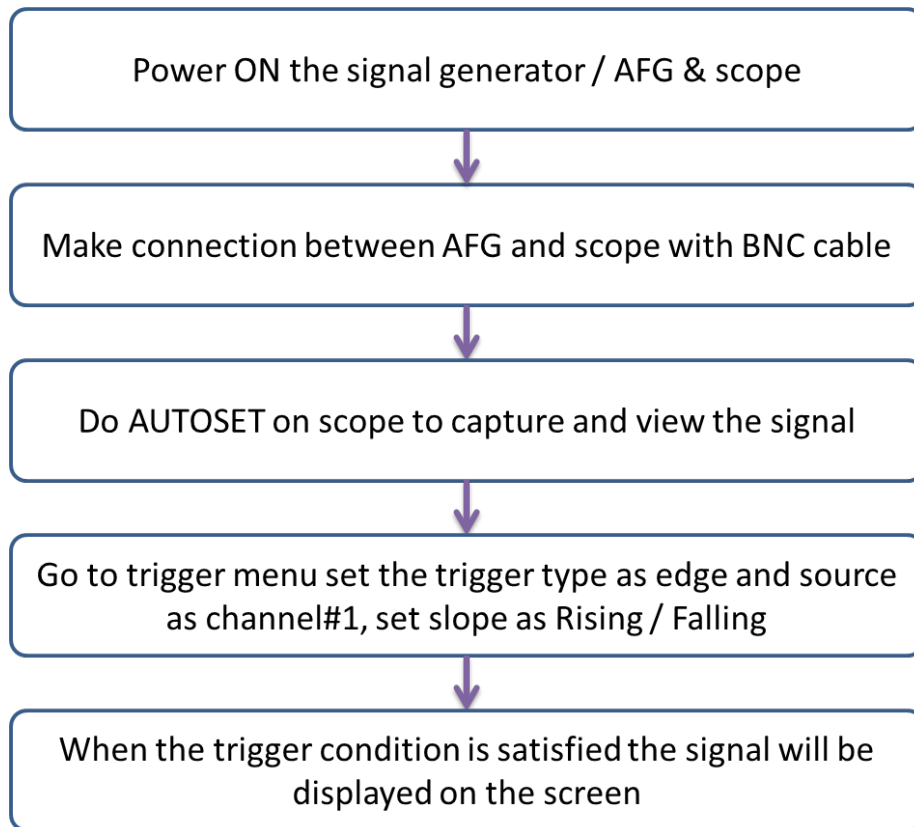

Triggering

Lab Exercise – Edge Triggering

For the given signal:

1. To understand the basics of trigger systems / functions
2. To use edge trigger for capturing a signal when amplitude rises above / fall below a defined amplitude

Procedure / Algorithm

AFG / Signal Generator Setting		
	Channel # 1	Channel # 2
➤ Signal Type	Square wave	-
➤ Amplitude	2 Vp-p*	-
➤ Frequency	1 kHz	-

Oscilloscope Measurement Labs

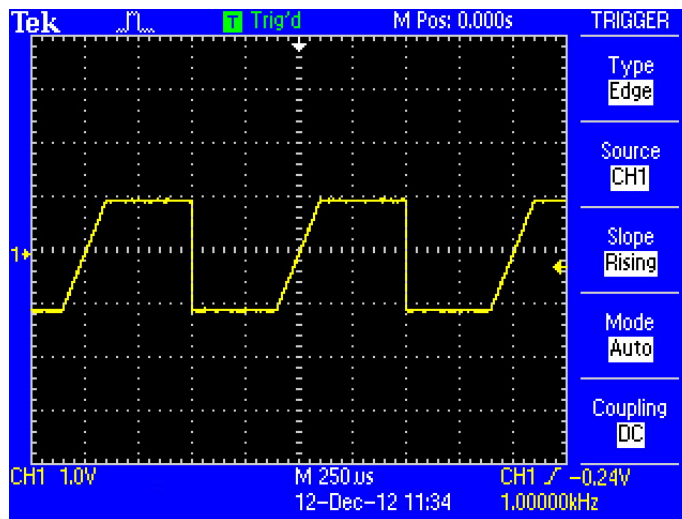

Triggering

Observations (Execution)

We observe that:

- In trigger setup, if we select Edge triggering as trigger Type and if we select rising edge as Slope, then the signal trigger point will be on the Rising edge of the waveform.
- If we select Falling edge as Slope then the signal will be captured with the trigger on the falling edge.

Screenshots:

Rising edge trigger with pulse wave

Falling edge trigger with pulse wave

Oscilloscope Measurement Labs

Triggering

Rising edge trigger with sine wave

Falling edge trigger with sine wave

With this experiment, we learned:

- How to use the trigger function on the oscilloscope to trigger on the positive or negative edge of a signal.

In real-life applications, we can use this concept:

- To analyze the seismic waves from the earth to for early detection of an earthquake
- To capture a stable waveform even with noisy / irregular wave shape. Oscilloscopes that are capable of advanced triggering are ideal for troubleshooting glitches, timing violations, overvoltage and dropouts in analogue and digital circuits.

Oscilloscope Measurement Labs

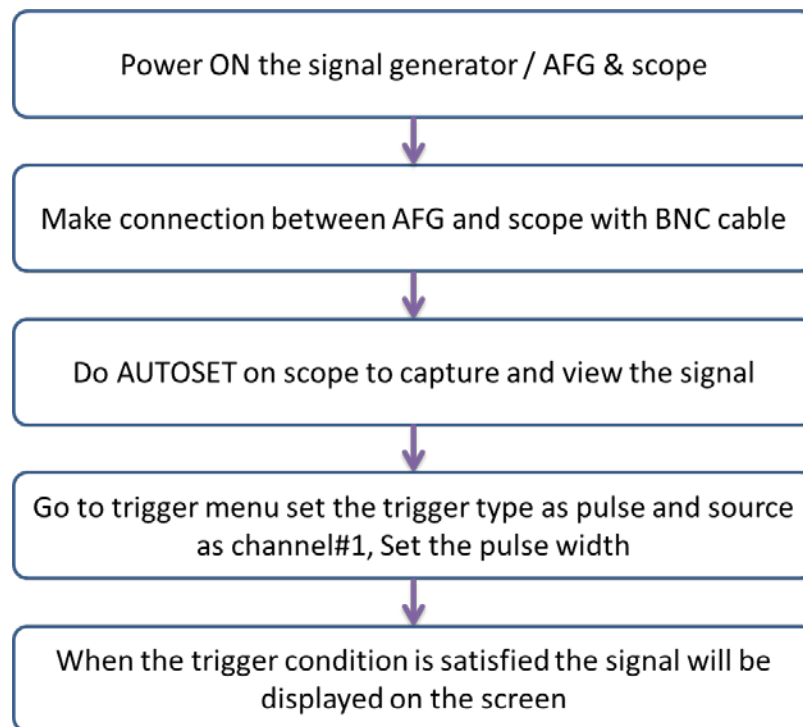

Triggering

Lab Exercise – Pulse Width Triggering

For the given signal:

1. To understand the basics of trigger systems / functions
2. To capture a signal when pulse width is = or \neq specified value
3. To capture a signal when pulse width is $>$ or $<$ specified value

Procedure / Algorithm

AFG / Signal Generator Setting

	Channel # 1	Channel # 2
➤ Signal Type	Square wave	-
➤ Amplitude	2 volt (pk-pk)	-
➤ Frequency	1 kHz	-

Oscilloscope Measurement Labs

Triggering

Observations (Execution)

We observe that:

- If we select Pulse Triggering as trigger type, and if we select
 1. '>' as when to trigger, then signal will trigger when the pulse width is **greater than** specified.
 2. '<' as when to trigger, then signal will trigger when the pulse width is **less than** specified.
 3. '=' as when to trigger, then signal will trigger when the pulse width is **equal to** (within 5%) specified.
 4. '≠' as when to trigger, then signal will trigger when the pulse width is not equal (not within 5%) to specified.

Screenshots:

a) Pulse width is greater than specified value

b) Pulse width is less than specified value

c) Pulse width is equal to specified value

d) Pulse width is not equal to specified value

With this experiment, we learned:

- How to use the trigger function to trigger a signal when the pulse width of the signal is less than, greater than and equal to a specified pulse width.

In real-life applications, we can use this concept:

- To look for pulses those are narrower than the normal (glitches) on microcontroller data and control lines.
- To trigger on pulse width modulation (PWM) waveforms.
