Tektronix Virus and Malware Control Policy Statement

September 9, 2010

Dear Customer,

Tektronix recognizes the potential risks of computer virus infections on Windows®
based products. We have taken precautions to assure instruments manufactured,
calibrated, serviced, repaired, and demonstrated by Tektronix are free of malware
and other computer based threats.

Tektronix products support, but are not equipped with virus protection software. If
these instruments are going to be placed on a network, it is highly recommended
that you add such software. Prior to leaving Tektronix, these products were
checked for known viruses and to the best of Tektronix' assurances, are
considered clean of known security threats.

There are two important ways of protecting your Tektronix Microsoft Windows
based test and measurement equipment from virus infection. The first way is
through the use of commercially available virus scanners. Your Information
Technologies (IT) department very likely already deploys one of these scanners.
Tektronix encourages the installation and use of whichever virus scanner your IT
department recommends. The second way is through the installation of Microsoft's
Security Patch updates. Minimally, Microsoft makes security patch updates
available every second Tuesday of the month. Tektronix recommends the
installation of "critical" and "important" Microsoft Security Patch Updates following
your IT departments processes and procedures for download, installation, and use
of these patch updates.

Despite all the precautions, should you encounter issues with your virus scanner or
have questions regarding a particular security configuration, please contact
Tektronix for further information regarding valid product configurations.

Sincerely,

Christopher M. Perez
