Key Aspects of Measurement							Measurement which compares the useful amplitude of the signal to the un-compensable distortions and noise.	Lower limits on amplitude, ISI; noise limit.	OJF: un-correlated jitter. IEEE: jitter.	Limits the random jitter for a transmitter.	Limits the asymmetry of the transmitter.

SNDR (PAM4)

The Signal to Noise Distortion Ratio (SNDR) measurement is the principal electrical measure of transmitter performance in all 400G specifications today.

$$SNDR = 10 \log_{10} \left(\frac{P_{max}^2}{\sigma_e^2 + \sigma_n^2} \right) \text{ dB}$$

The SNDR is a ratio of P_{max} (the maximum of the linear fit pulse response) to the sum of the linear fit error σ_e and σ_n and the noise extracted from consecutive long run lengths of symbols.

These three parameters have error contributions directly related to the instrumentation bandwidth, jitter noise floor and vertical noise floor. The combination of 70 GHz of instrument BW allows tracking a fourth order Bessel-Thomson electrical response to the -10dB point (at 69 GHz), which offers flat phase response and minimal instrument contributed data-dependent jitter. The σ_e term is heavily influenced by instrument contributed jitter noise floor, and that contribution on an AT architecture can be as low as 40fs on some signals. The σ_n term is heavily influenced by the instrumentations effective number of bits and overall vertical noise contribution. The key to the most accurate SNDR measurement performance is to maximize the P_{max} term (requires approximately 50 GHz bandwidth) and minimize the instrument contributed jitter and vertical noise components.

Eye Height at BER (Noise Decomp), T_{mid}, V_{mid}

The method of placement of these detection thresholds is governed by IEEE 802.3 and OIF-CEI.

Results

SNDR : 32.3385 dB Peak : 93.3169 mV Pulse vf : 120.4123 mV

Sigma_e : 1.7642 mV Sigma_n : 1.4036 mV Pulse Peak: 77.4979% *vf

Signal-to-noise-and-distortion ratio (min)

94.3, 12.7 31 dB

TDECQ Transmitter and Dispersion Eye Closure - Quaternary

TDECQ after Reference Equalizer

TDECQ Example (Optical PAM4): 26GBaud

- Reference equalized PAM4 eye is sliced with two vertical histograms:
 - 0.1 UI apart, at 0.04 UI width
 - Target SER is e.g. 4.8e-4
- For each vertical slice:
 - Capture histogram and calculate measured bathtub
 - Find bathtub opening in terms of RX noise, compare to ideal, express as a penalty (the smaller the better)

Optical - 50G, 200G, 400GBASE-LR/LR4/LR8, FR/FR4/FR8 WDM (Wavelength Division Multiplexing)

Optical - 100G, 400GBASE-DR/DR4 parallel single-mode fiber

Optical - 200GBASE-DR4 parallel single-mode fiber

Optical - 50/100/200GBASE-SR/SR2/SR4 parallel multi-mode fiber

Electrical - 50, 100 or 200GBASE-CR/CR2/CR4 or KR/KR2/KR4

All diagrams: for clarity, only one direction of transmission is shown.
SMF: single-mode fiber. MMF: multi-mode fiber. WDM: wavelength div. multiplexing.
Note: Optical 400GBASE-SR16 at 25 GBd PAM2 NRZ not shown
