

when the supporting circuitry for ring modulators required for both tuning and driving the modulator is considered, it is inevitable that energy consumptions on the order of 200 fJ/bit or higher will be required. As a result, a traveling-wave modulator such as the one demonstrated here might prove attractive for future communications applications.

Acknowledgments

Assistance with 20 Gb/s testing from Klaus Engenhardt at Tektronix is gratefully acknowledged. The authors would like to thank Matthew Goodman of DARPA for support under the ZOE program and Gernot Pomrenke, of the Air Force Office of Scientific Research, for support under the OPSIS and PECASE programs. Lastly, the authors would like to thank Mario Panniccia and Justin Rattner, of Intel, for their support of the Institute for Photonic Integration.
