Multi-Measurement Prober Cable Kit Quick Start Guide

Overview

The Keithley Instruments Model 4210-MMPC-S multi-measurement cable kit (see Figure 1) is a collection of standard and custom connectors and accessories used to take I-V and C-V measurements using a single prober cable setup. It is also used with the Keithley Model 4200-PIV-A package to perform pulse I-V measurements. This kit has been assembled for use with the Suss Micro Tec PA200/300 prober series.

NOTE For C-V testing, this Quick Start Guide applies to both the Model 4200-CVU card and the new 1 kHz Model 4210-CVU card. For pulse I-V testing, this guide also applies to the Models 4200-PG2 and 4205-PG2 pulse generators.

Prober cable kit contents

Figure 1 shows the cables, adapters, and supplies that are included in the Model 4210-MMPC-S multi-measurement cable kit.

Figure 1: Model 4210-MMPC-S multi-measurement prober cable kit

Quick Start Guide topics

The guide contains information about the installation and use of this cable kit:

- **Connecting Model 4200** instrumentation to the prober bulkhead: Explains how to make connections from the Model 4200 to the prober bulkhead.
- **Installing the prober cable kits:** Explains how to make connections from the prober bulkhead to the prober pins.
- **Usage scenarios:** Provides the specific prober cable setups for I-V testing (2-wire and 4-wire) and C-V testing (2-wire and 4-wire). It also provides the setup for performing pulse I-V measurements using the Keithley Model 4200-PIV-A.

Related documents

The following documents (in PDF format) are located on the Model 4200 Complete Reference CD:

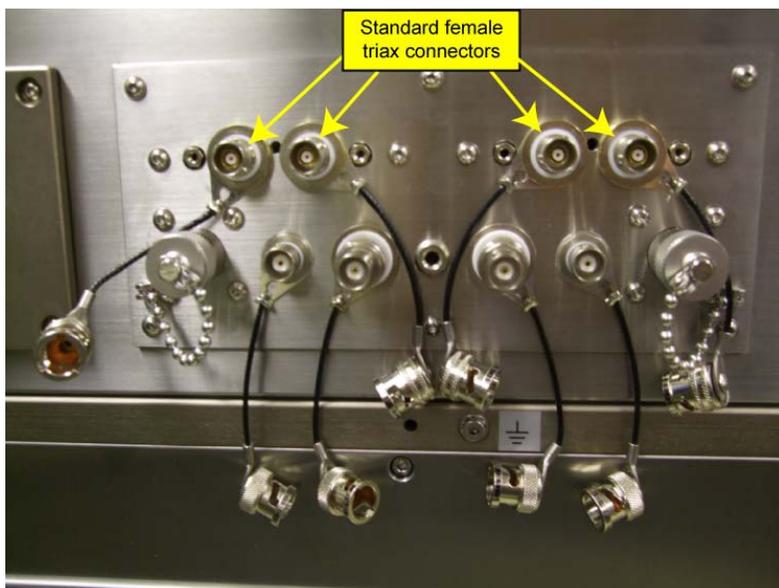

- **PA-993:** This is a one-page packing list for the Model 4210-MMPC-S Multi-Measurement Prober Cable Kit for the Suss Micro Tec PA200/300 series prober. A photo shows all the components of the cable kit.
- **PA-994:** This is a one-page packing list for the Model 4210-MMPC-C Multi-Measurement Prober Cable Kit for the Cascade MicroTech 12000 series prober. A photo shows all the components of the cable kit.
- **White Paper – Labs’ Demands for Greater Measurement Flexibility Require Cabling Systems Capable of Accommodating Multiple Measurement Types:** This white paper explains the different cabling requirements for I-V, C-V, and pulse I-V testing. It also describes an easy-to-use single multi-measurement cabling system (Model 4210-MMPC-S for the Suss Micro Tec PA200/300 prober).

Connecting Model 4200 instrumentation to the prober bulkhead

WARNING *To prevent injury or death due to electric shock, remove all power from the Model 4200-SCS and shut down the Suss prober before installing the prober cable kit.*

The Model 4200 connects to the female triax connectors on the prober bulkhead. Figure 2 shows the triax connectors on one of the two connection panels of the prober.

Figure 2: Prober bulkhead female triax connectors

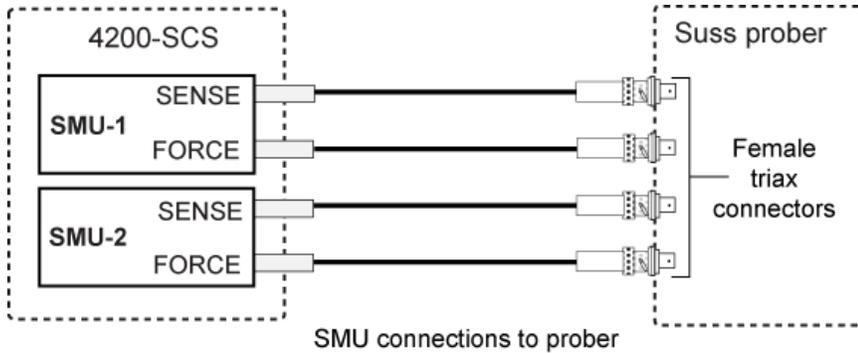

I-V testing

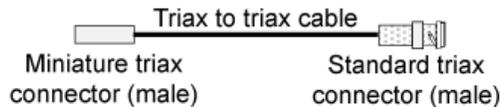

For I-V testing, connect the triax cables of your Model 4200 source-measure units (SMUs) to the standard female triax connectors on the bulkhead of the prober. Figure 3 shows two Model 4200 SMU prober connections.

NOTE Figure 3 shows SMUs that do not use preamps. These SMUs use the supplied triax cables that are terminated with a miniature triax connector on one end and a standard triax connector on the other end. If your SMUs are equipped with preamps, use the supplied cables that are terminated with standard triax connectors on both ends. Figure 3 shows both cables.

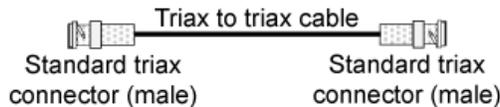

Figure 3: Model 4200 SMU connections to the prober

SMUs with preamps not installed:

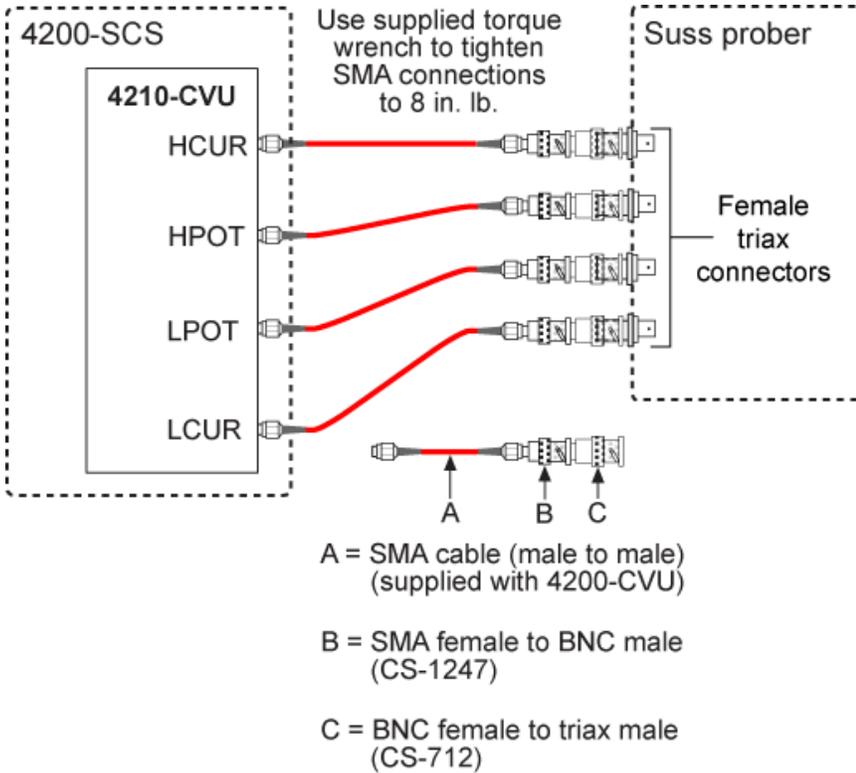

SMUs with preamps installed:

C-V testing

Two probe cable kits include the cable adapters needed to connect the SubMiniature version A (SMA) cables of the Model 4210-CVU to the female triax connectors on the bulkhead of the prober. Figure 4 shows how to make the connections. A torque wrench is supplied with the Model 4210-CVU.

Figure 4: Model 4210-CVU prober connections

Pulse I-V testing using the Keithley Model 4200-PIV-A

Perform 4-pin pulse I-V measurements using four prober cable kits with the Keithley Instruments Model 4200-PIV-A package, which includes a scope card, pulse generator card, software, and other components.

Use the supplied cables and connectors to connect the Model 4200 to the bulkhead of the prober (see Figures 5 and 6).

Figure 5 shows the Model 4200 connections to the prober and the trigger connection between the scope card (Model 4200-SCP2) and pulse generator card (Model 4205-PG2). Figure 6 identifies the cables and adapters used to make the connections.

NOTE Figure 5 shows source-measure units (SMUs) that are not equipped with preamps. These SMUs use the supplied triax cables that are terminated with a miniature triax connector on one end and a standard triax connector on the other end. If your SMUs are equipped with preamps, use the supplied cables that are terminated with standard triax connectors on both ends. Figure 6D shows both cables.

NOTE Four prober cable kits are required for 4-pin, PIV-A pulse I-V testing.

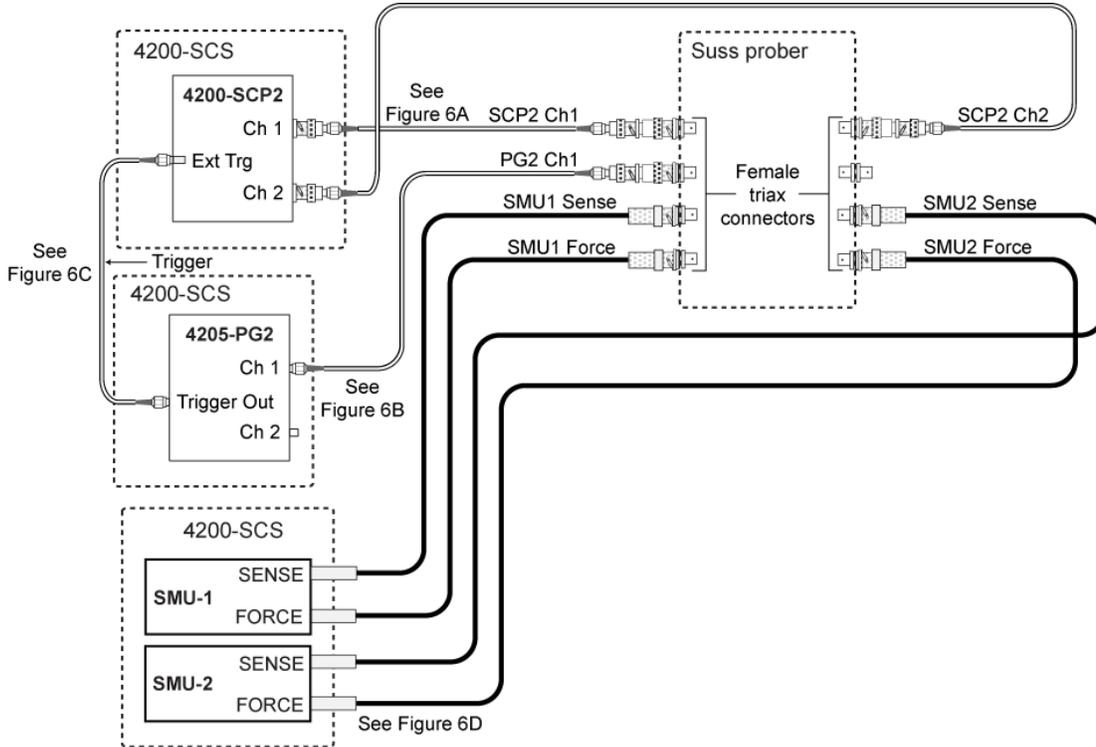

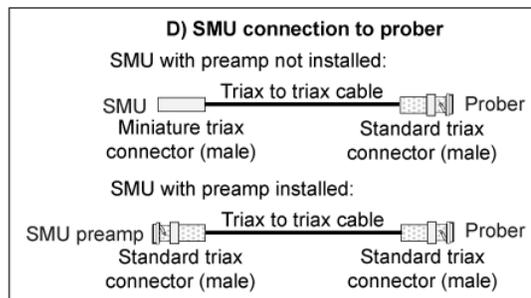

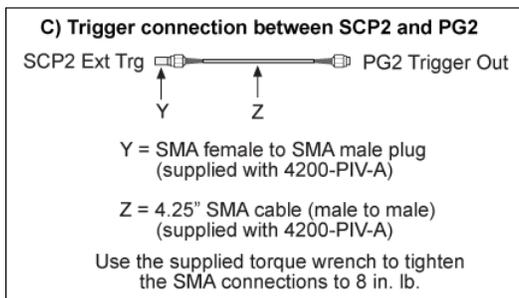

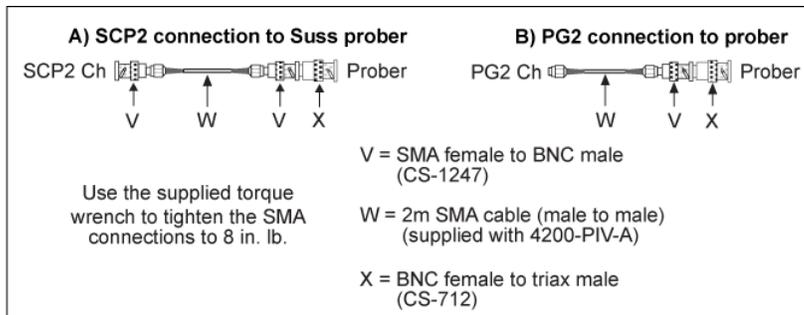

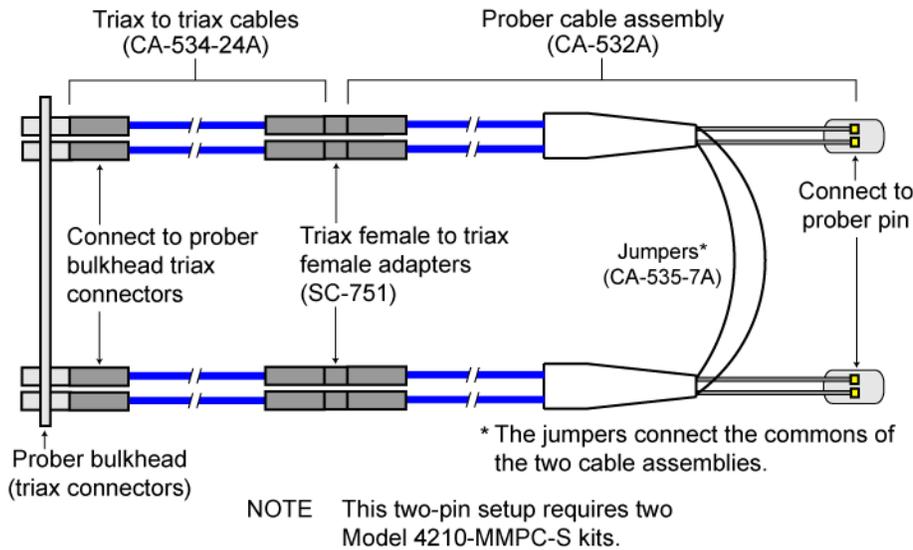

Figure 6: Cables and adapters used for instrumentation connections

Installing the prober cable kits; basic cable setup

Figure 7 shows the basic cable setup for the 2-pin I-V and C-V testing scenarios described in this guide. The 4-pin I-V and 4-pin C-V testing scenarios require minor setup changes; pulse I-V setup, which is more complex, is described later in this quick start guide.

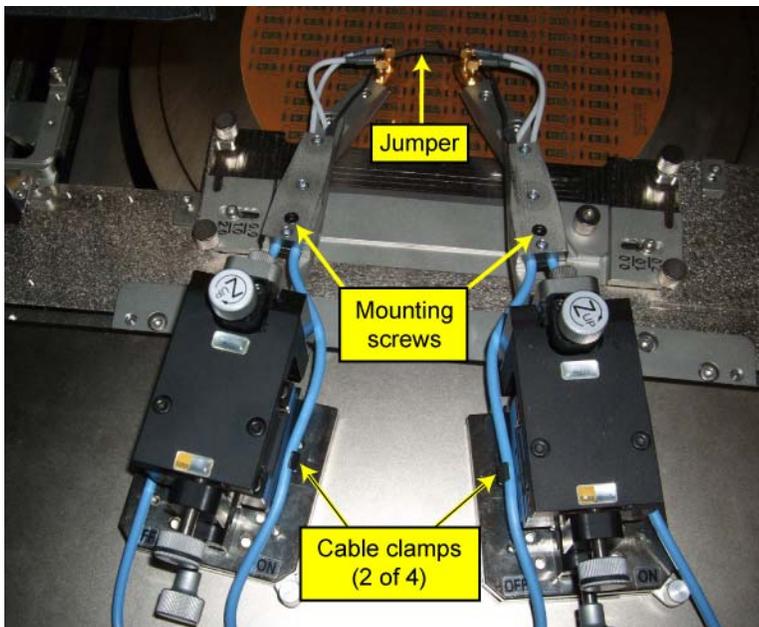

Figure 7: Basic 2-pin prober cable setup

Installation guidelines

Figure 8 shows the prober cable assemblies of two Model 4200-MMPC-S kits installed in a Suss Micro Tec PA300 prober.

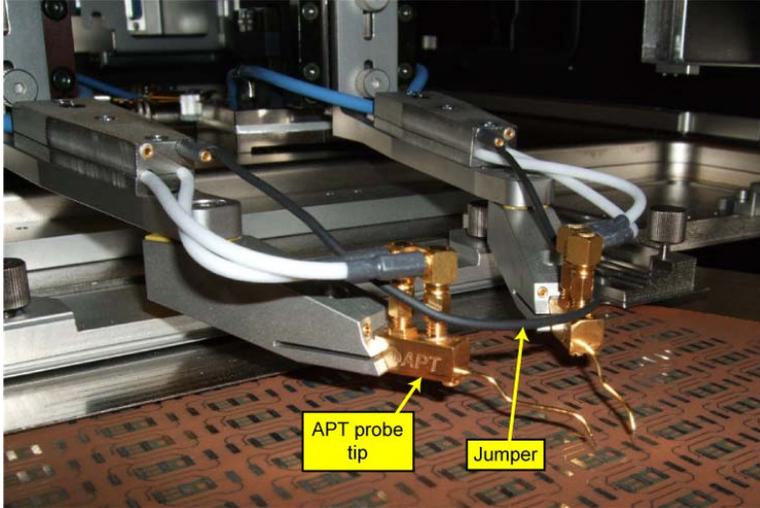

Figure 8: Two prober cable assemblies installed in Suss prober

- Each prober cable assembly is secured to a manipulator by a single mounting screw. Figure 8 shows the location of the mounting screws. Firmly tighten the cable assemblies to the manipulators.

- As shown in Figure 8, route the blue cables along the sides of the manipulators. Use the cable clamps to firmly secure the cables to the manipulators. Make sure the clamps are tight enough to keep the cables from moving.
- Connect a black jumper from one cable assembly to the other. This jumper (shown in Figure 8) connects the commons of the two cable assemblies together. The jumper plugs into the ends of the assembly blocks. It is good practice to install the second jumper. It not only improves the connection, but it is a good place to store the extra jumper. Figure 9 shows another view of the jumper.

Figure 9: Front view of the installed prober cable assemblies

- Connect the cable wires of the cable assemblies to the APT probe tips, as shown in Figure 9.
- Figure 9 shows an example of good routing for the jumper and cable wires. When routing the wires, consider the possible movements of the manipulators.
- Connect the triax to triax cables to the triax connectors on the prober bulkhead (see Figure 7). Connect the other ends of the triax cables to the prober cable assemblies using the supplied triax female to triax female adapters.

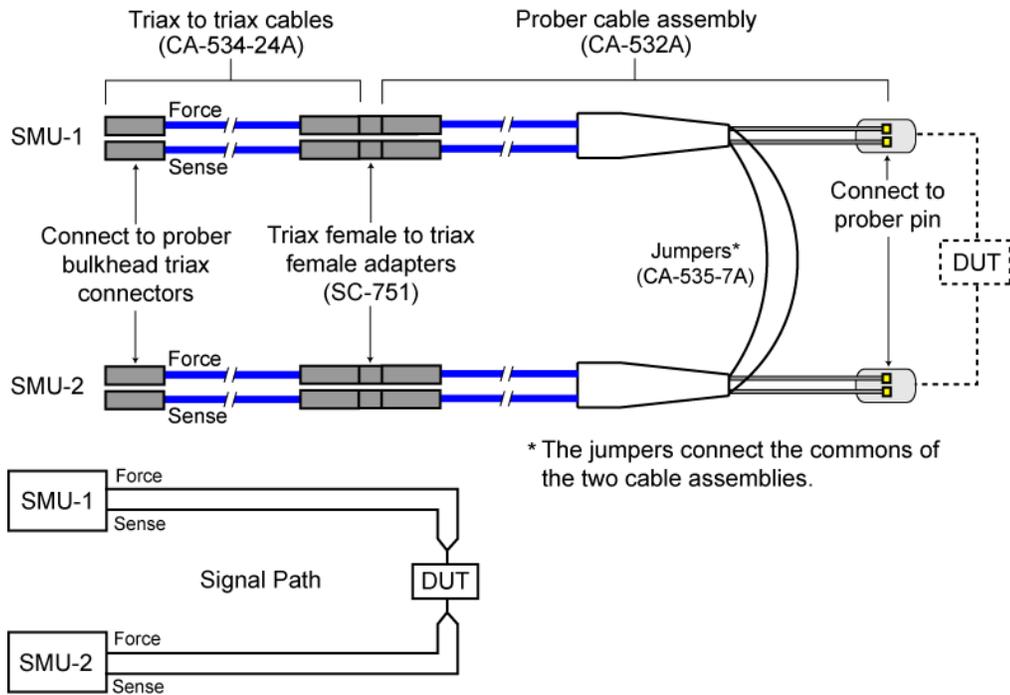

Usage scenarios

I-V testing: 2-pin I-V setup

NOTE The setup for 2-pin I-V testing requires two prober cable kits.

With two Model 4200-SMUs connected to the prober bulkhead, use the fundamental setup shown in Figure 10 to perform 2-pin I-V testing. Figure 3 shows the SMU connections to the outside of the bulkhead.

Figure 10: Test setup for 2-pin I-V testing

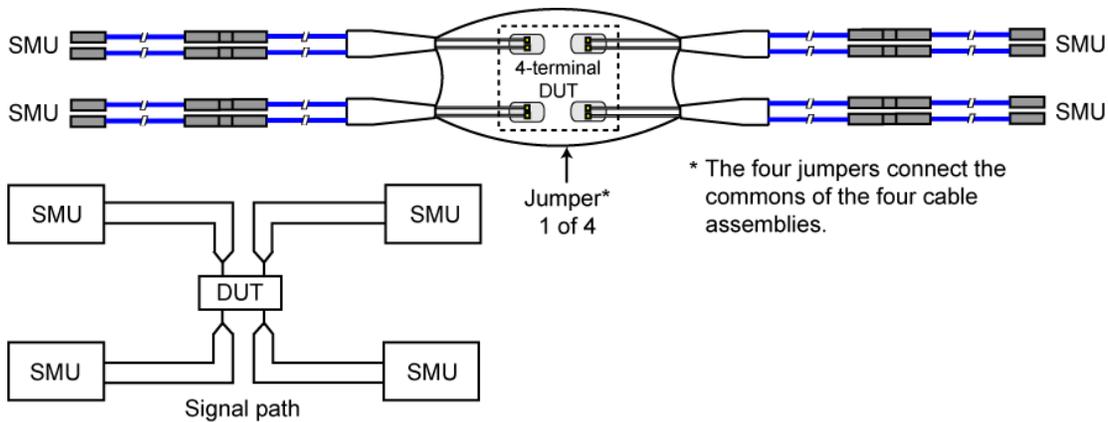

I-V testing: 4-pin I-V setup

With four Model 4200-SMUs connected to the prober bulkhead, use the setup shown in Figure 11 to perform 4-pin I-V testing. Figure 3 shows two SMUs connected to one of the bulkhead connection panels. Connect two additional SMUs to the other bulkhead connection panel.

NOTE The setup for 4-pin I-V testing requires four prober cable kits.

Figure 11: Test setup for 4-pin I-V testing

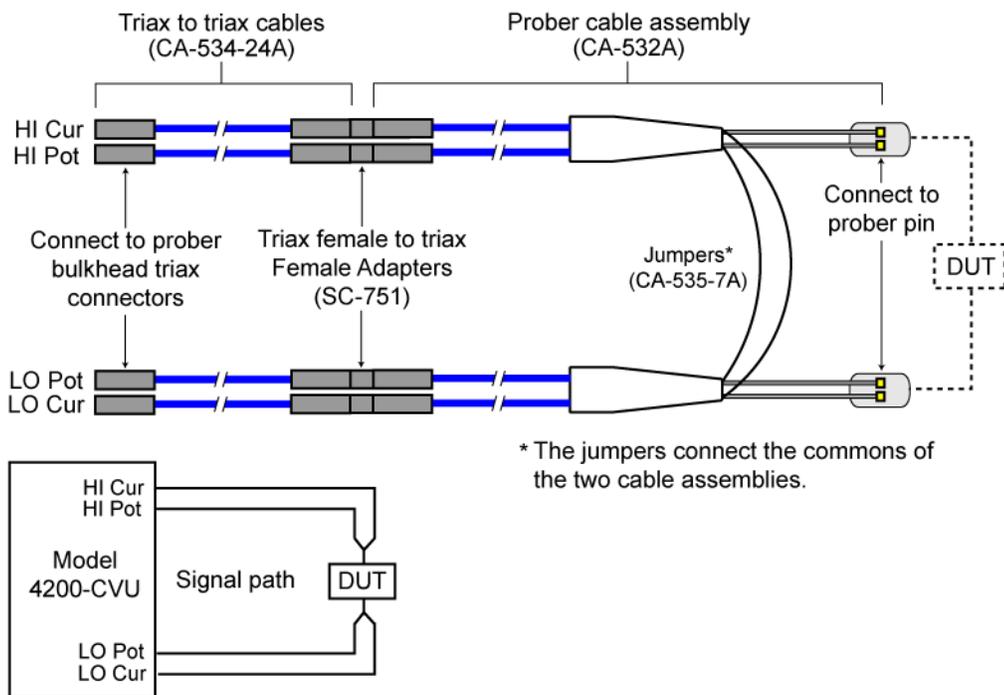

C-V testing: 2-pin C-V setup

NOTE The setup for 2-pin C-V testing requires two prober cable kits.

With a Model 4210-CVU connected to the prober bulkhead, use the fundamental setup shown in Figure 12 to perform 2-pin C-V testing. Figure 4 shows the CVU connections to the outside of the bulkhead.

Figure 12: Test setup for 2-pin C-V testing

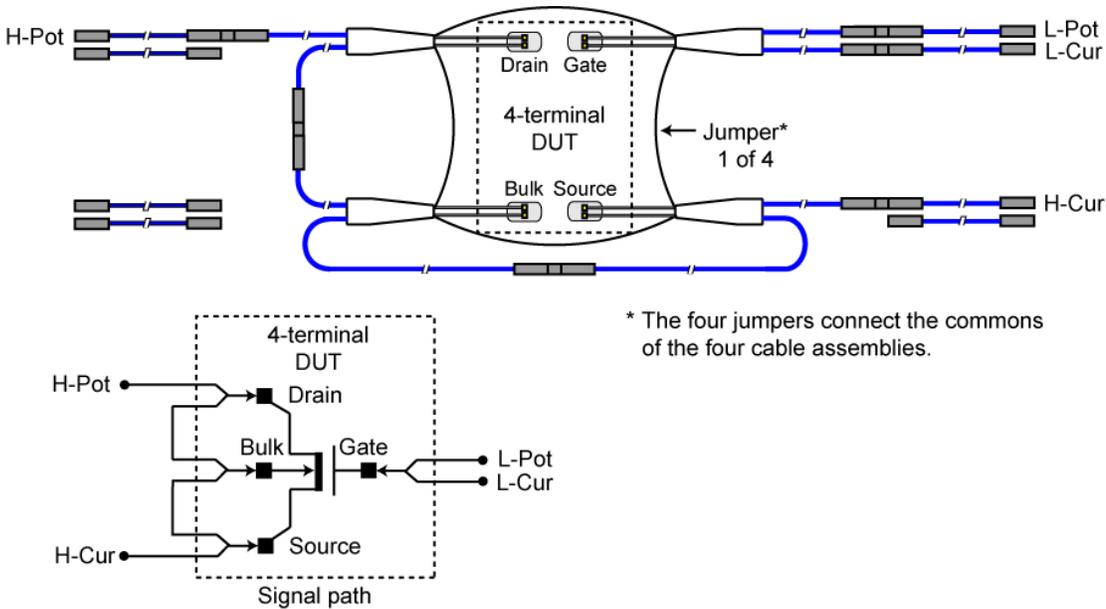

* The jumpers connect the commons of the two cable assemblies.

C-V testing: 4-pin C-V setup

NOTE The setup for 4-pin C-V testing requires four prober cable kits.

A typical test for a field effect transistor (FET) is to connect the drain, bulk, and source together and perform the measurement across the gate. With a Model 4200-CVU connected to the prober bulkhead, use the setup shown in Figure 13 to perform 4-pin C-V testing.

Figure 13: Test setup for 4-pin C-V testing

Four-pin pulse I-V test setup using the Keithley Model 4200-PIV-A

NOTE The setup for 4-pin pulse I-V testing requires four prober cable kits.

The Model 4200-PIV-A is a factory-installed package that includes a scope card, pulse generator card, software and other components to perform 4-pin pulse I-V measurements.

The test setup for using the Model 4200-PIV-A is shown in Figures 14, 15, and 16. Figure 14 shows the connections from the prober bulkhead to the gate and source of the 4-terminal device. Figure 15 shows the connections from the bulkhead to the drain and bulk. Figure 16 shows the jumper connections. The four jumpers connect the commons of the cable assemblies together. Figure 5 shows how the Model 4200 connects to the outside of the bulkhead.

NOTE Details on using the Model 4200-PIV-A package are provided in the Model 4200-SCS User's Manual (see *How to use the Model 4200-SCS to perform a pulse I-V test on my device* in Section 3). Figure 3-25 shows the block diagram of the test setup.
